Introduction

420 Series Mobile Piston Pump

The Eaton® X20 portfolio of open-circuit piston pumps is built to maximize machine performance and productivity. With sophisticated controls that enhance system efficiency and a compact design that delivers incredible power, the X20 portfolio empowers mobile machine operators to do more work in less time using less fuel.

Sophisticated controls that improve performance while optimizing efficiency.

Excellent pressure responsiveness – The X20 portfolio delivers the fastest response and recovery times in the open-circuit piston segment, helping customers get the job done faster.

Low standby pressure – The X20 portfolio can maintain low margin pressure (~150 psi) with exceptional stability, reducing heat generation and helping to eliminate wasted energy.

Stable fan drive functionality – Eaton's fan drive control reaches desired speed more quickly and remains stable once there, reducing energy-wasting oscillation.

Advanced electronic controls – The cold start and fan drive controls are Pro-FX Ready, meaning they can be easily configured with pre-programmed development tools and controlled electronically for maximum flexibility and precision.

Winning load sense combination – X20 works in conjunction with Eaton's CLS Load Sense Sectional Mobile Valve, providing OEMs one resource for their machine's load sense needs.

Compact design that enables greater flexibility and cost savings.

Simplified pump architecture – The X20 pump has 25% fewer components than traditional pumps, reducing the number of leak points and simplifying maintenance.

Compact package size – The X20 portfolio's small size satisfies Tier 4 requirements and provides more flexibility when designing the engine compartment.

More horsepower – The compact rotating group delivers a remarkable amount of horsepower, improving productivity without using more fuel.

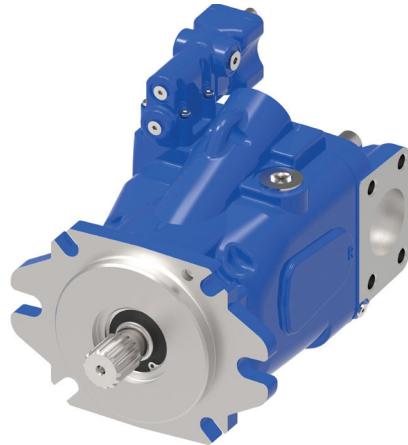

One-piece housing – Single-piece pump housing removes leak points and makes maintenance faster and easier versus more complicated multi-piece housings.

Multiple options that make it easy to specify exactly what you need.

Variety of control options – Including pressure control, load sense, cold start, torque control, remote pressure control, inverse proportional pressure control, proportional pressure control, electronic displacement control, and swash sensor feedback, giving you more ways to design more efficient, productive machines.

Several displacement options – With seven displacement options, there's an X20 pump to fit virtually any mobile application need.

Eaton's 420 Series is available with displacements of 41cc, 49cc, 62cc, and 80cc for operating speeds at 2,650 rpm. A strong, field-proven rotating group allows the pumps to handle pressures to 280 bar (4060 psi) continuous and 320 bar (4600 psi) intermittent.

The combination of high load capacity bearings and a stiff drive shaft help provide a pump B10 bearing life of up to 10,280 hours at rated mobile conditions, reducing operating costs and extending operating life.

Variety of mounting options – The X20 portfolio is available with both SAE and ISO mounting flange configurations, can be side- or rear-ported, and offers multiple drain ports to help overcome any installation challenges.

Exceptional quality that provides remarkable reliability.

Unique control piston design – Single-acting control piston with special coating helps minimize friction, increasing operating life.

Bronze piston shoes – Bronze piston shoes are robust against contamination should particles enter the fluid, enhancing system performance and component service life.

High-load bearings – Larger, more durable bearings resist wear and deliver industry-leading bearing life.

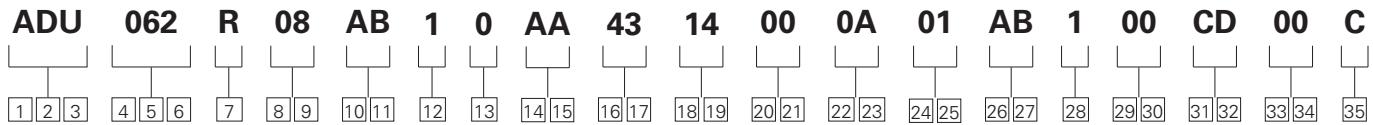

3-year manufacturer's warranty – Eaton's warranty terms provide peace of mind for three full years, helping you get through your warranty period with complete confidence.

Global network of Eaton-certified experts for end-to-end support.

More partners in more regions – Growing network of Eaton distributors around the world ensures there's local service and support anywhere you need it.

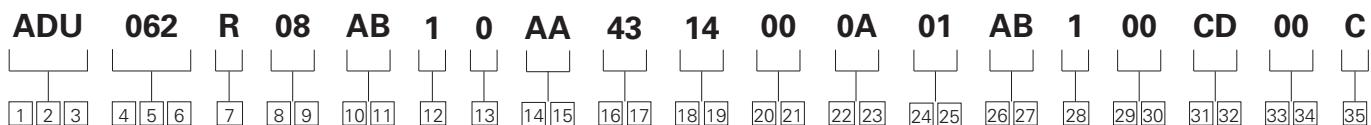

World-class system design and assembly – Our expert distribution partners can help with everything from specifying to prototyping and assembly to commissioning, so you can focus on other areas of your business.

Eaton-standardized practices and processes – Eaton employs a unique system of tools and processes, known as the Eaton Business System, to ensure quality development and delivery of the 220 X20 product. These tools and process include such known methods as Design for Six Sigma, Lean Manufacturing and ISO certification.

For more information, see Eaton publication 579. For operation on other alternative or environmentally friendly fluids, please contact your Eaton representative.

Control options

Pressure & Flow (Load Sense) Compensator

The pump will provide flow & pressure matching of pump output to system load demand, maximizing efficiency and improving load metering characteristics of any directional control valve installed between the pump and the load. Load sensing ensures that the pump always provides only the amount of flow needed by the load. The pump operating pressure adjusts to the load pressure plus a pressure differential required for the load sense margin. When the system is not demanding flow, the load sense control will operate in low pressure zero flow, energy saving stand-by mode. The differential pressure is the difference between the pressure inlet and service port of a proportionally controlled directional valve, or a load sensing directional control valve. See the model code for differential pressure settings for load sensing. If the load pressure exceeds the system pressure setting, the pressure compensator reduces pump displacement. The load sensing line must be as short as possible and can also be used for remote pressure control or unloading of the pump pressure. For remote pressure control purposes, it is recommended that you contact your Eaton Representative for the correct configuration of the control.

Warning:

- When adjusting the pressure compensator, install a 0 to 350 bar (0 to 5000 psi) gage in the outlet gage port and limit the pressure setting to the continuous rated pressure for the pump displacement. It is possible to adjust the pressure compensator beyond the rated pressure of the pump. Doing so, may void the warranty of the pump.
- EATON recommends use of relief valve in all systems.

Pressure limit settings

The pressure compensator uses two springs to cover the full pressure range of the X20 pumps.

Spring 1 = < 140 bar (2050 psi)

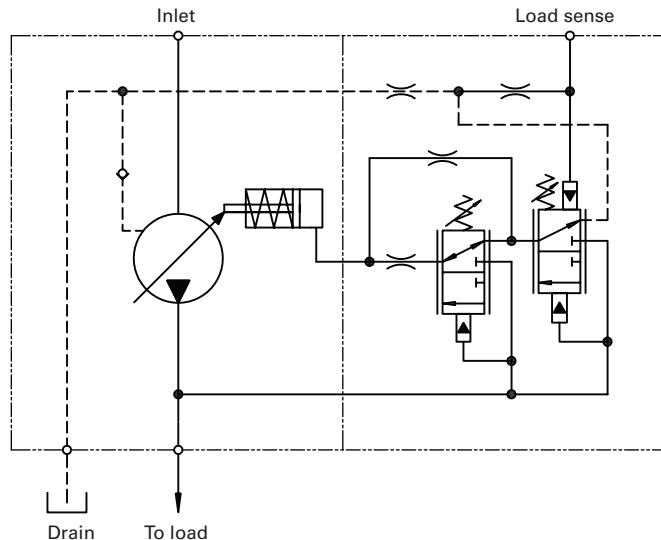

Spring 2 = 145 - 280 bar (2100 - 4060 psi)

Flow compensator (load sense) settings

There are two springs used to cover the load sense adjustment range of this control. Available load sense range is

Spring 1 = < 20 bar (290 psi)

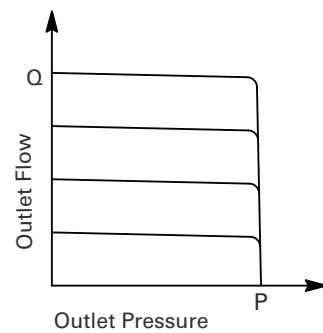

Spring 2 = 22- 42 bar (319- 609 psi).

Dynamic response per SAE J745 (using swash plate position)

	Response (off stroke) msec	Recovery (on stroke) msec	Load sense recovery msec
ADU041	20	75	90
ADU049	20	75	90
ADU062	25	90	115
ADU080	26	75	115

Typical operating curve

The pump will provide a continuously modulated flow to meet changing load demands at a pre-adjusted compensator pressure. At pressures below the compensator setting, the pump will operate at maximum displacement. See model code position 16,17 for compensator pressure ranges.

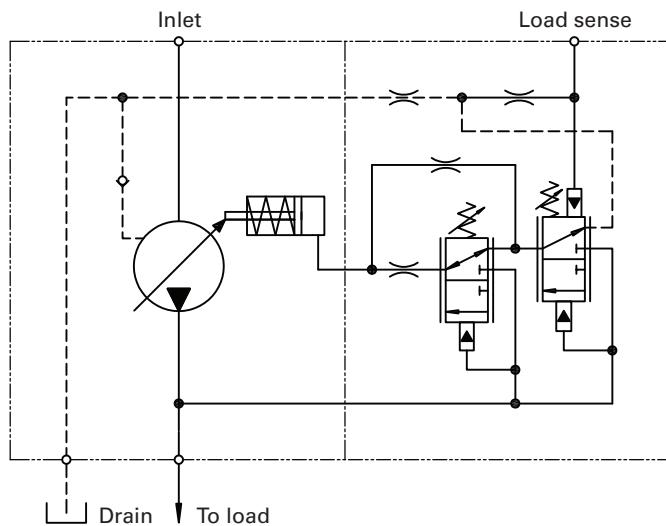

Warning

- When adjusting the pressure compensator, install a 0 to 350 bar (0 to 5000 psi) gage in the outlet gage port and limit the pressure setting to the continuous rated pressure for the pump displacement. It is possible to adjust the pressure compensator beyond the rated pressure of the pump. Doing so, may void the warranty of the pump.

- EATON recommends use of relief valve in all systems.

Pressure limit settings

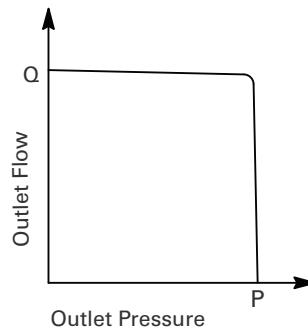

The pressure compensator uses two springs to cover the full pressure range of the X20 pumps. The high pressure spring covers the range from 140 bar (2050 psi) to 280 bar (4060 psi). The low pressure spring is adjustable from minimum pressure through 140 bar (2050 psi).

Dynamic response per SAE J745 (using swash plate position)

	Response (off stroke)	Recovery (on stroke)
	msec	msec
ADU041	20	75
ADU049	20	75
ADU062	25	90
ADU080	26	75

Pressure cut-off characteristics of pressure compensator control at 49°C (120°F), static conditions.

Control options

Torque Control

The torque control limits the torque input to the pump preventing the engine from stalling while also optimizing the use of the engine power.

When combined with Pressure Compensator Control and/or Load Sense, it will allow the pump to remain inside the power envelope of the Pressure Flow curve. When the combination of pump flow and outlet pressure moves outside the envelop the pump displacement will automatically be reduced.

This maximum setting is easily calculated using the following steps:

- Select the 420 pump displacement you intend to use
- Identify the available engine horsepower (HP) and speed (rpm)
- Calculate the torque limit required by the system using the equations shown
- Select the MAX torque setting from the table shown

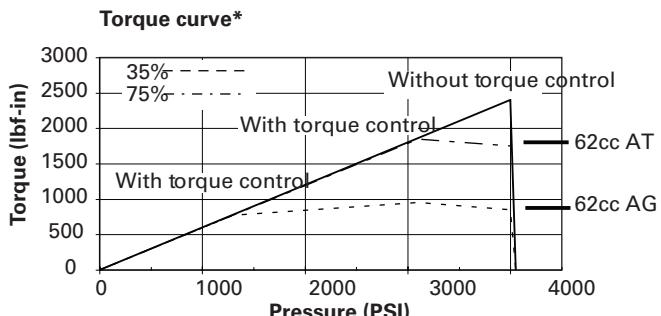

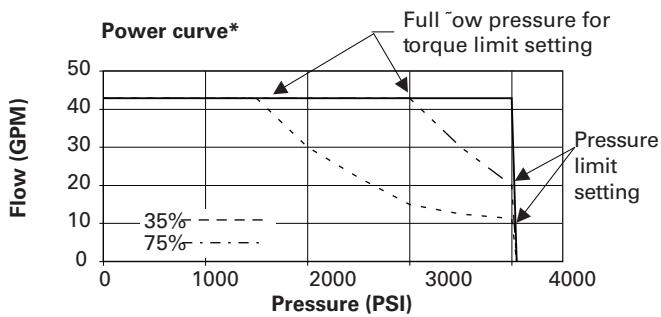

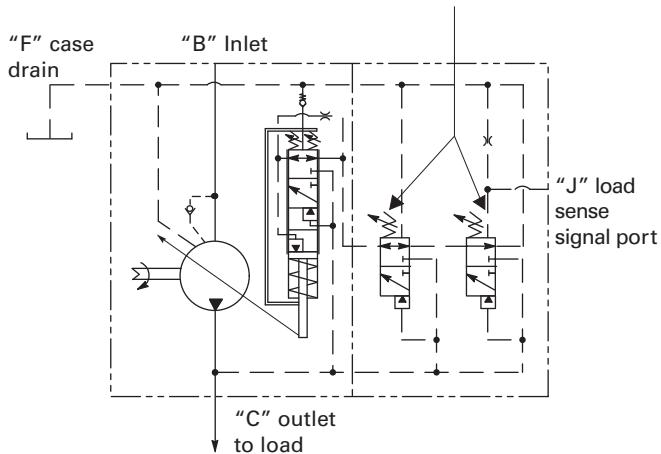

$$\text{Torque (in-lbs)} = \frac{\text{Horsepower (HP)} \times 63025}{\text{Engine RPM}}$$

$$\text{Torque (Nm)} = \frac{\text{Horsepower (KW)} \times 9550}{\text{Engine RPM}}$$

* reference 62cc

See page 5 & 6 for pressure compensator control and load sense

Control options

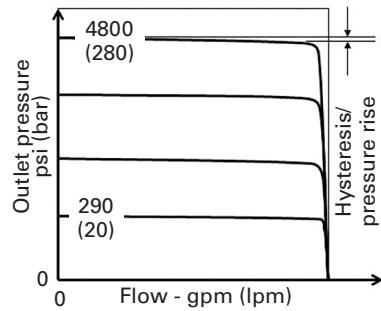

Remote Pressure Control (RPC)

Remote relief valve is to be connected to pilot port "J" through necessary external piping. Standard differential pressure of 20 bar is set at RPC spool. The required outlet pressure (below 280 bar) can be set by adjusting remote relief valve setting. Once pressure reaches preset value, flow across remote relief valve starts, this results in RPC spool movement due to pressure imbalance. This will de-stroke the pump to maintain the set pressure.

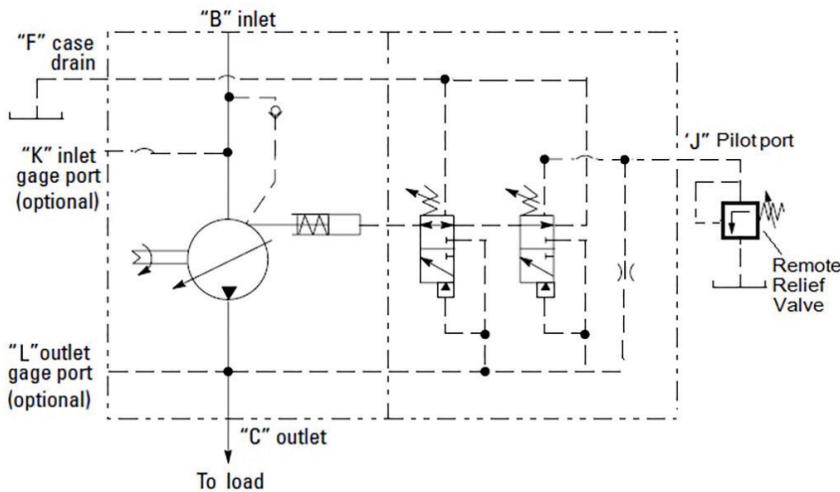

Secondary pressure compensator is provided to limit the max pressure setting as a fail safe measure. The delta pressure is factory set which can not be changed.

Note-

- Flow compensator is not available with RPC.
- Flow compensator/ Remote pressure control setting should be selected within range of 10-24 bar (140-350 psi).
- Remote relief valve is not included in supply scope of the pump.
- If the remote line is connected directly to tank, the flow compensator setting selected in the model code will be the minimum pressure setting.

Delta pressure setting at control valve - bar (psi)	14 - 24 (200 - 350)
Control fluid consumption - lpm (gpm)	4.5 (1.2) max.
Recommended flow rating of remote relief valve- lpm (gpm)	3 - 5 (0.8 - 1.32)
Recommended Eaton Relief Valve part number	RV5-10-S-0-50

Control options

X20 Electronic Displacement Control (EDC)

Pump displacement can be controlled step-less, as per the current signal provided to the solenoid control valve. The integrated pump control makes use of an external current signal to vary the pump displacement. This control has an proportional characteristic i.e. with increasing current signal, the displacement increases proportionately.

This control is with manual override. Based failsafe condition there are two types:

Min type (EP): Return to min displacement in case of power loss.

Max type (EPD): Return to max displacement in case of power loss

Warning: The pressure setting may be adjusted beyond the rated pressure of the pump. When adjusting the pressure, install a 0-350 bar (0-5000 psi) gage in the outlet gage port and limit the pressure setting to the continuous rated pressure for the pump displacement.

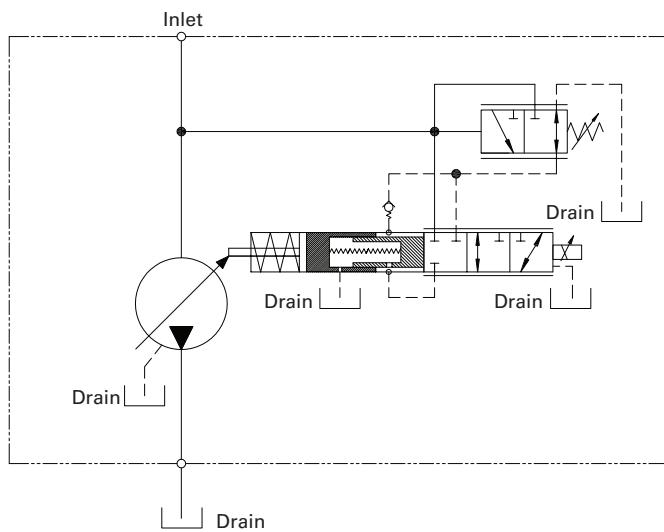

Pressure limit settings

The EDC covers pressure range of the X20 pumps. The max pressure can be set from 140-280 bar (2050-4060 psi).

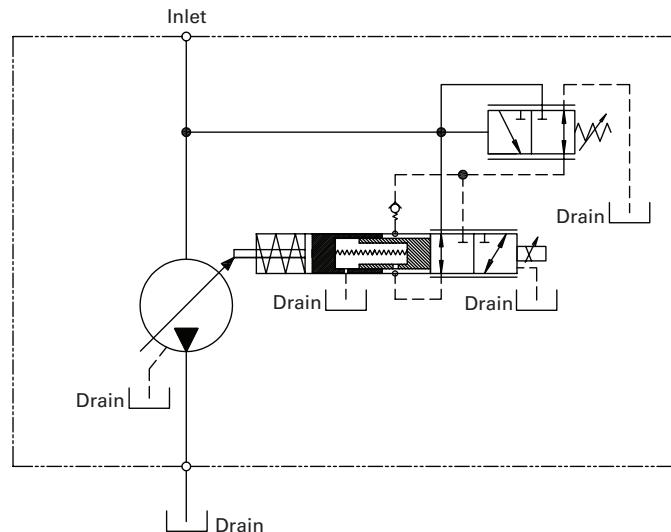

Electrical data

Control options

EH Inverse Proportional Pressure Control (IPPC)

The EH Inverse Proportional Pressure control allows for step less variation of the max pump output pressure, as per the current signal provided to the control valve solenoid.

The integrated pump control makes use of an external current signal to vary the pump output pressure.

This control has an inverse proportional characteristic i.e. with increasing current signal, the max output pressure is proportionately reduced.

Warning:

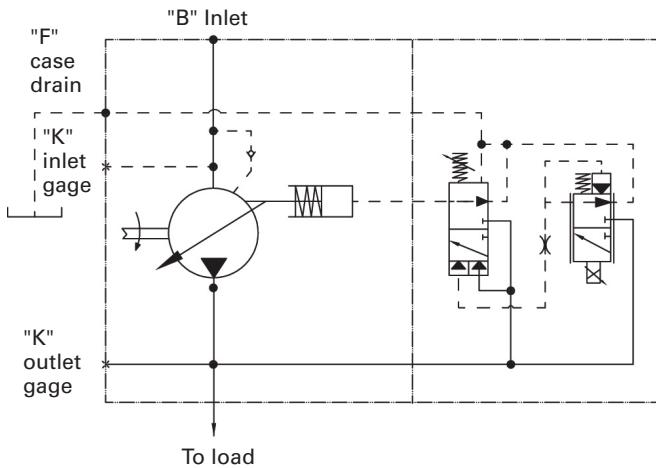

- When adjusting the pressure compensator, install a 0 to 350 bar (0 to 5000 psi) gage in the outlet gage port and limit the pressure setting to the continuous rated pressure for the pump displacement. It is possible to adjust the pressure compensator beyond the rated pressure of the pump. Doing so, may void the warranty of the pump.
- EATON recommends use of relief valve in all systems.

Pressure limit settings

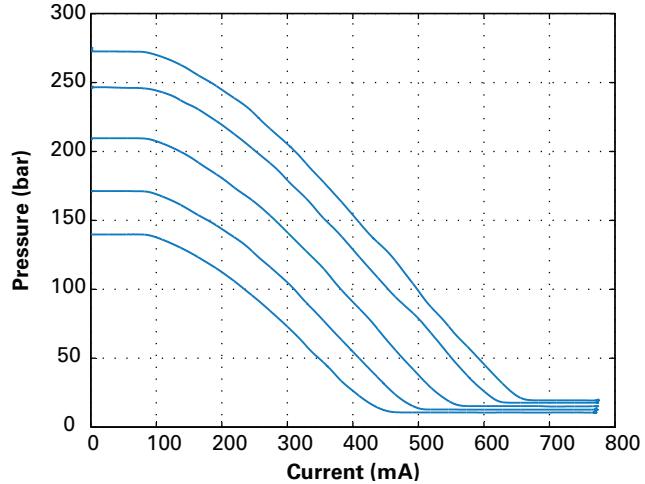

The EH IPPC pressure can be set in the range of 140 bar (2050 psi) to 280 bar (4060 psi).

Control options

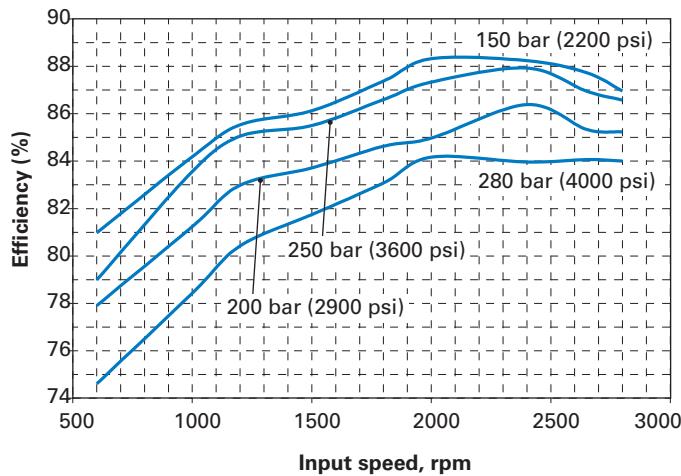

Electronic De-stroke (Cold Start) Valve

The 620 Electronic Destroke Valve reduces pump start-up torque by directing outlet pressure to the control piston.

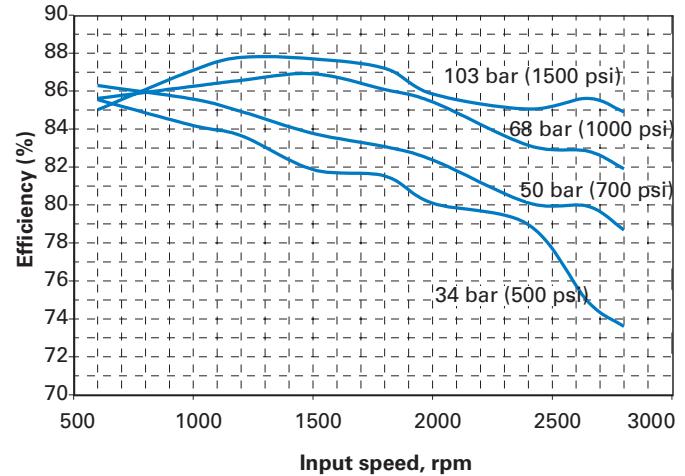

It is primarily used in cold weather applications and includes a 12 or 24 VDC directional control valve mounted between the pump housing and compensator. Refer model code position 22,23 - control special features for available connector options

(1056 in-lbf)

$\varnothing 19.33$ (.761) 11 tooth 30° Flat root side $\pm 16/32$ class 1 internal spine per SAE J498B

Accepts 11 tooth 30° at root side $\pm 16/32$ external splines per SAE J498B class 1 or ANSI B92.1 class 5 with 31.8 (1.25) extension from mounting angle

Additional units driven by this spline must not require more than 118.6 N-m (88 Lbf-ft) of torque

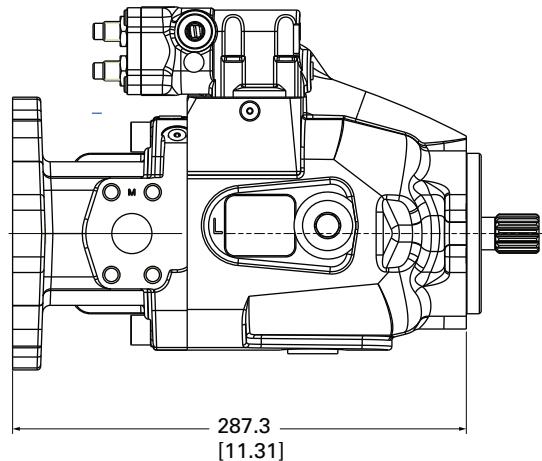

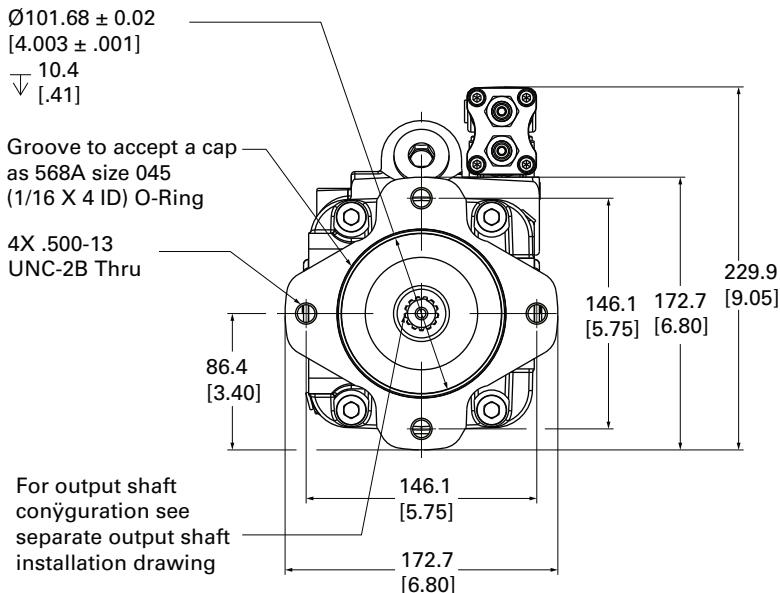

With double shaft seal and C-mount

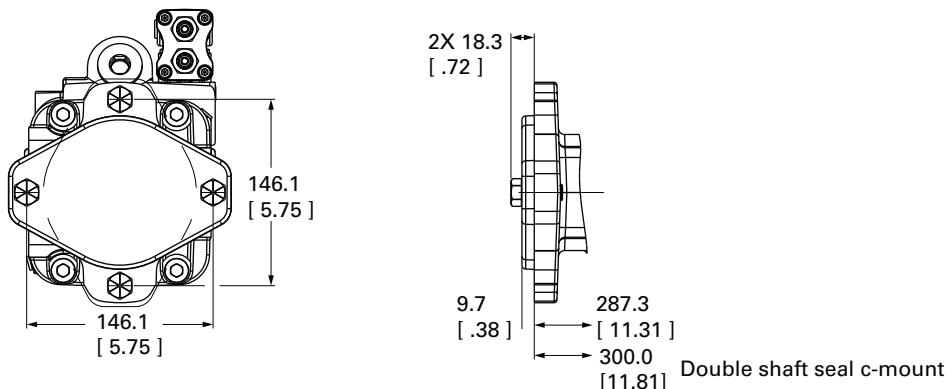

Pump installation

Thru-Drive SAE B

Thru-drive SAE B

SAE B thru-drive cover plate installation

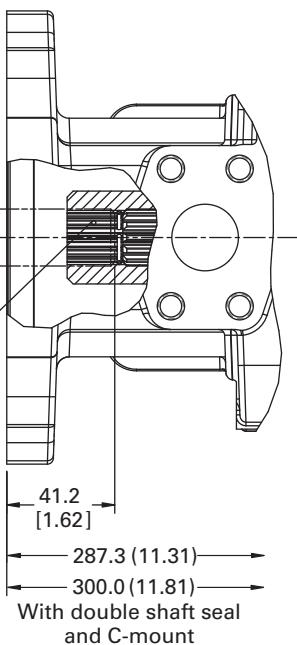

Output shaft installation

13T spline

Maximum torque 209 Nm
(1850 in-lbf)

$\varnothing 22.5$ (.886) 13 tooth 30° at root side $\frac{1}{16}$ /32 class 1 internal spline per SAE J498B

Accepts 13 tooth 30° at root side $\frac{1}{16}$ /32 external splines per SAE J498B class 1 or ANSI B92.1 class 5 with 41.2 (1.62) extension from mounting angle

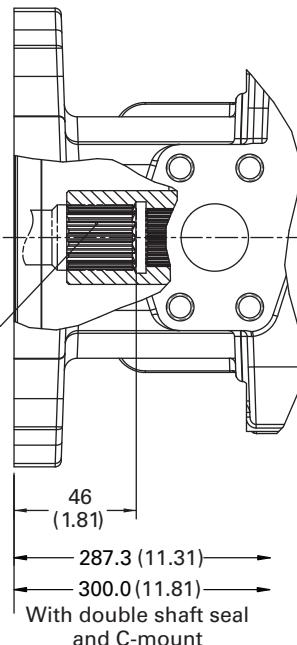

Output shaft installation

13T spline

Maximum torque 337 Nm
(2987 in-lbf)

$\varnothing 25.5$ (1.006) 15 tooth 30° at root side $\frac{1}{16}$ /32 internal spline per ASA B5.15-1960

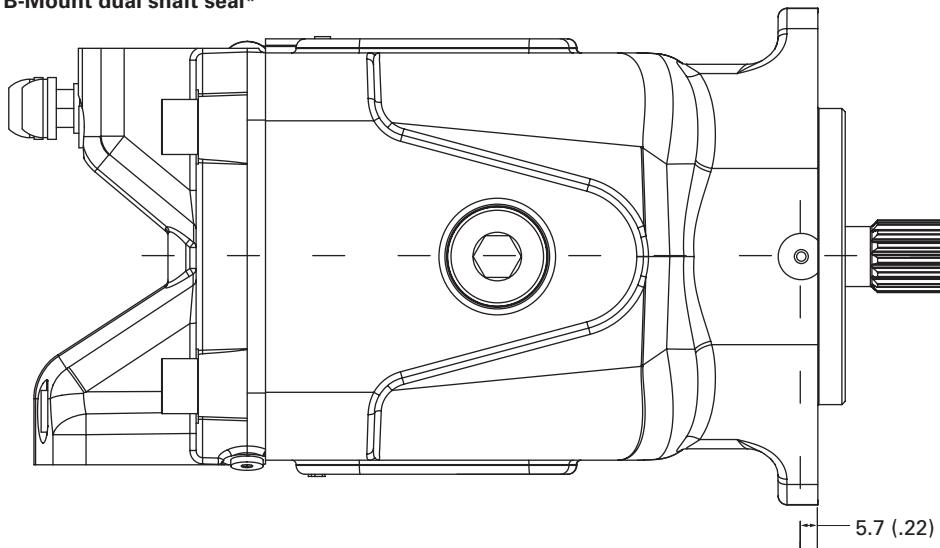

Accepts 15 tooth 30° at root side $\frac{1}{16}$ /32 external splines per SAE J498B class 1 or ANSI B92.1 class 5 with 46 (1.81) extension from mounting angle

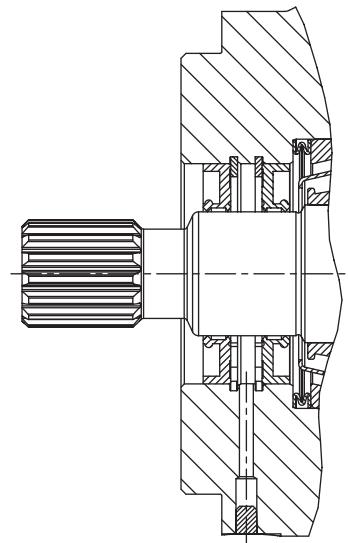

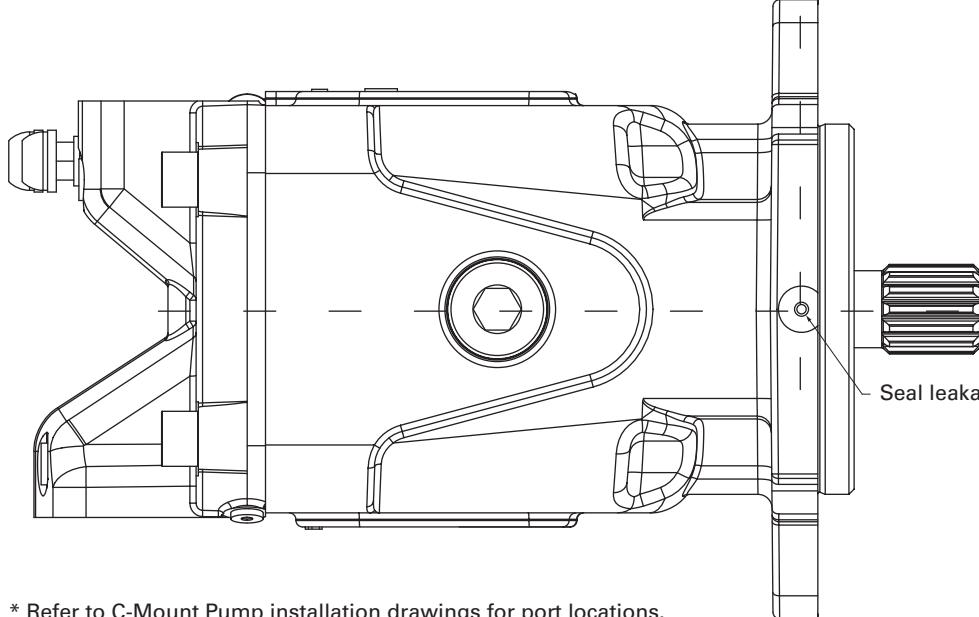

Pump installation

Dual shaft seal option

B-Mount dual shaft seal*

C-Mount dual shaft seal*

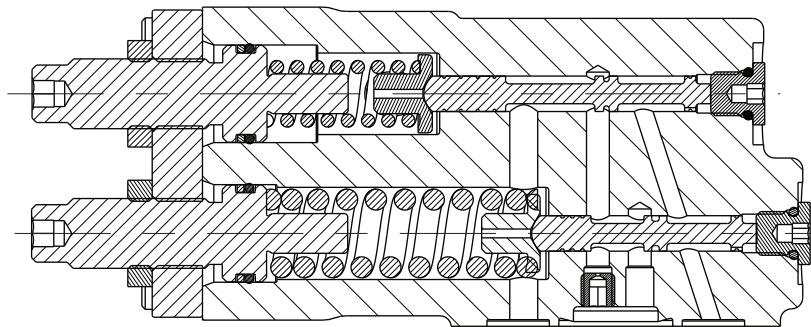

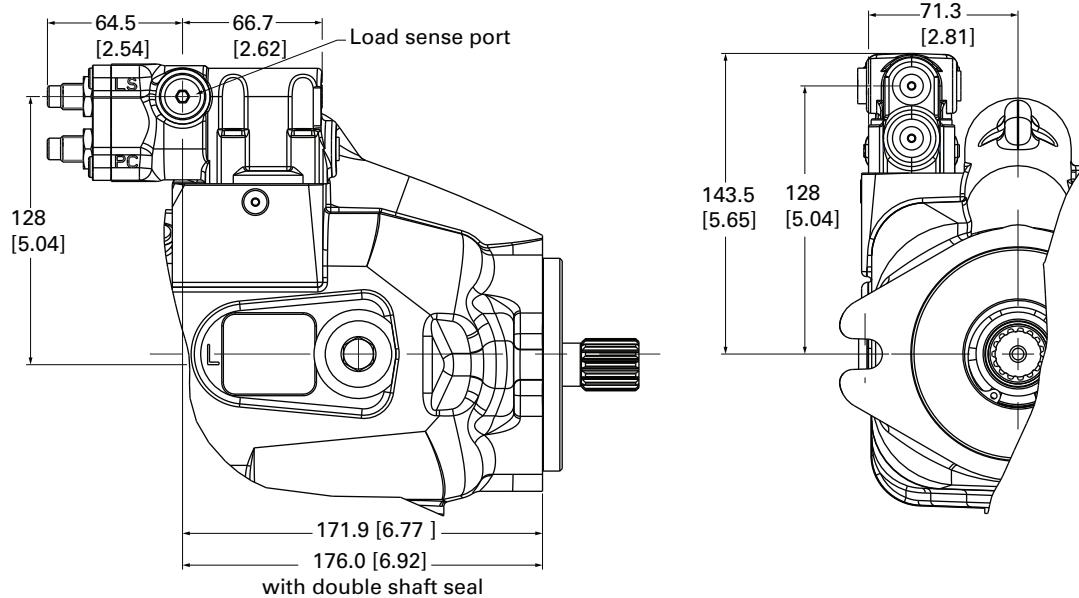

Cross section of dual shaft seal assembly

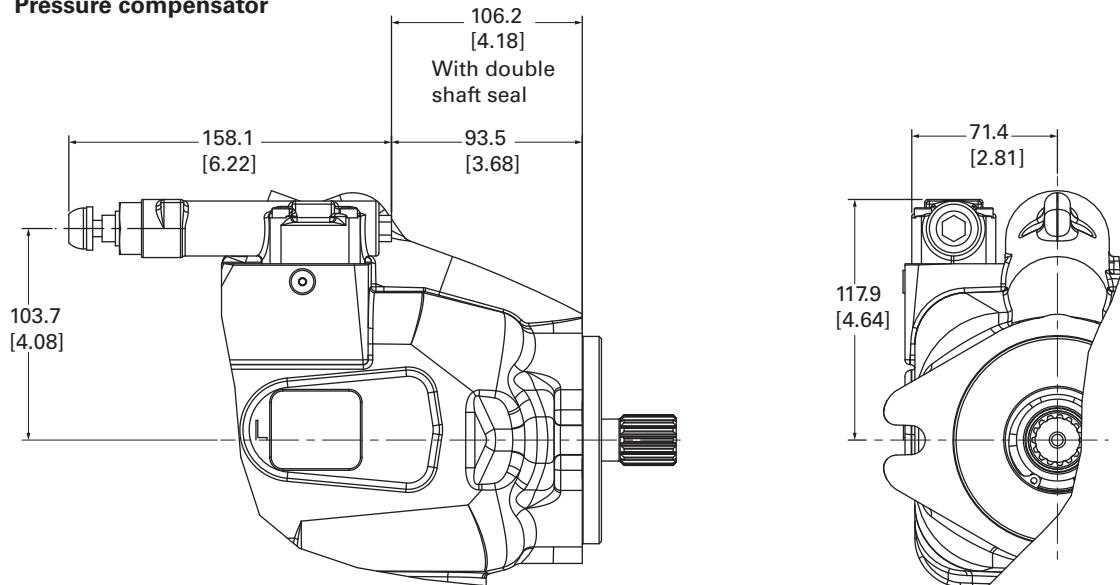

* Refer to C-Mount Pump installation drawings for port locations.

Examples: Calculation L_1 and L_2 **Tandem ADU062 Thru-drive with ADU041 rear ported**

$$L_1 = L_{cg} \quad 131.3\text{mm (5.17 inches)}$$

$$L_2 = L_t + L_{cg} \quad 287.3\text{mm} + 109.6\text{mm} \\ = 396.9\text{mm (15.6 inches)}$$

Tandem dual seal ADU049 Thru-drive with ADU049 side ported

$$L_1 = L_{cg} + L_{ds} \quad 131.5\text{mm} + 13\text{mm} = 144.5\text{mm} \\ (5.69 \text{ inches})$$

$$L_2 = L_t + L_{ds} + L_{cg} \quad 287.3\text{mm} + 13\text{mm} + 114.7\text{mm} \\ = 415\text{mm (16.34 inches)}$$

Tandem pump applications

Eaton recommends that tandem pump applications be provided with additional support to limit overhung loading of the mounting flange. The thru-drive alternate attachment points on the rear flange may be used with a customer designed support.

Installation and start-up

Warning: Care should be taken that mechanical and hydraulic resonances are avoided in the application of the pump. Such resonances can seriously compromise the life and/or safe operation of the pump.

Drive data

Mounting attitude should be horizontal using the appropriate case drain ports to ensure that the case remains full of fluid at all times. Consult your local Eaton Representative if a different arrangement is required.

In those cases where geometric tolerances of mounting are critical, or where specific tolerance ranges are required and not specified, consult Eaton Engineering for specific limits.

Direction of shaft rotation, viewed from the prime mover end, must be as indicated in the model designation on the pump – either right hand (clockwise) or left hand (counterclockwise).

Direct coaxial drive through a flexible coupling is recommended. If drives imposing radial shaft loads are considered, please consult your Eaton Representative.

Start-up procedure

Make sure the reservoir and circuit are clean and free of dirt/debris prior to filling with hydraulic fluid.

Fill the reservoir with filtered oil and fill to a level sufficient enough to prevent vortexing at the suction connection to pump inlet. It is good practice to clean the system by flushing and filtering, using an external slave pump.

Caution: Before the pump is started, fill the case through the uppermost drain port with hydraulic fluid of the type to be used. The case drain line must be connected directly to the reservoir and must terminate below the oil level.

Once the pump is started, it should prime within a few seconds. If the pump does not prime, check to make sure that there are no restrictions between the reservoir and the inlet to the pump, and that the pump is being rotated in the proper direction, and that there are no air leaks in the inlet line and connections. Also check to make sure that trapped air can escape at the pump outlet.

After the pump is primed, tighten the loose outlet connections, then operate for five to ten minutes (unloaded) to remove all trapped air from the circuit.

If the reservoir has a sight gage, make sure the fluid is clear – not milky.

Fluid cleanliness

The 420 Series pumps are rated in anti-wear petroleum fluids with a contamination level of 21/18/13 per ISO 4406. Operation in fluids with levels more contaminated than this is not recommended. Fluids other than petroleum, severe service cycles, or temperature extremes are cause for adjustment of these codes. Please contact your Eaton Representative for specific duty cycle recommendation.

Eaton 420 Series pumps, as with any variable displacement piston pumps, will operate with apparent satisfaction in fluids up to the rating specified here. Experience has shown however, that pump and hydraulic system life is not optimized with high fluid contamination levels (high ISO cleanliness codes).

Proper fluid condition is essential for long and satisfactory life of hydraulic components and systems. Hydraulic fluid must have the correct balance of cleanliness, materials, and additives for protection against wear of components, elevated viscosity and inclusion of air.

Essential information on the correct methods for treating hydraulic fluid is included in Eaton publication 561 – “Eaton Guide to Systemic Contamination Control” – available from your local Eaton distributor. In this publication, filtration and cleanliness levels for extending the life of axial piston pumps and other system components are listed. Included is an excellent discussion of the selection of products needed to control fluid condition.
